

Environmental policy

The aim of Innoweld is to improve operational environmental protection and environmental performance. With the help of the introduced environmental management system, energy consumption and waste generation will be reduced and the health and safety of employees will be continuously improved.

- Environmental awareness and the environmental responsibility of personnel will be promoted with the use of instructions and training sessions.
- Environmental concerns will have an even greater influence in all areas, from purchase, and production to packaging and shipping.
- Innoweld strives for constant improvement in all environmental protection areas. Waste and emissions should be reduced to a minimum.
- We commit not only to observe all environmental laws, but also to protect the environment beyond the limits of the legislation. Compliance with statutory regulations, official requirements, and directives and standards for occupational health and safety and environmental protection must be ensured.
- Trained members of the environmental team come from all areas of the company and support management and staff in all environmental issues.
- The recording of data such as water, gas, and electricity consumption forms the basis for a reduction in energy consumption. By analysing the waste volume, new possible ways to prevent waste and to increase recycling will be found.
- Innoweld strives to reduce pollutants by using ecologically safe, raw, and auxiliary materials, if technically and economically possible. Resource-efficient raw and auxiliary materials are used in production.
- The company strives to use the best-available technology as far as is economically possible.
- We have decided NOT to use external communication.
- The impact of our activities on people and the environment is monitored, assessed, and documented. This includes precautions to prevent and limit accidents and faults.
- We use an integrated management system, the performance of which is regularly reviewed by management, in order to ensure environmental protection, health, safety, and quality in business processes, and to improve them on an ongoing basis.
